BIOVISION SURGVIEW™ SYSTEM EARNS MEDICAL PLAUDITS

Newly approved end-to-end micro-endoscope visualization praised for clarity, ease of use

[Location]—BioVision Technologies Corporation today announced its SurgView™ video imaging system, recently approved by the FDA (510K# K082293), has reached another milestone in medical validation.

“BioVision is excited that the SurgView™ system is receiving recognition as the ‘new gold standard’ for minimally invasive visualization,” said David Sanso, founder and President of BioVision. Sanso explained that BioVision is in active discussions with Biomet Microfixation, a subsidiary of Biomet Corporation, regarding the first commercial launch of the SurgView™, for use in a new procedure in the craniomaxillofacial area. “As part of those discussions the SurgView™ is being put through a battery of physician tests and trials, and we are happy to see it passing all tests with flying colors.”

“We are proud that we are becoming the go-to team for medical device manufacturers looking for innovative micro-imaging solutions that reduce incision size and speed healing,” Sanso said. “We believe our capabilities will help launch the next generation of micro-endoscopy, helping support innovative new procedures that will save lives and reduce healing time for patients.”

The BioVision Surgview™ system is a hand-held fully customizable end-to-end micro-imaging solution for medical endoscopy, from the tip of the scope to the plug at the end of the image display system. The full system includes the Surgview™ image display and capture unit - the most portable and compact endoscopic tower on the market - and a low-cost fiber-based 1.2mm endoscope. The scope can rigid, semi-rigid, or flexible, at many sizes can be steerable, and can be made in disposable or reusable forms.
